hypothetical protein At2g44130 [imported] - Arabidopsis thaliana
NiAlternate names: hypothetical protein F6E13.26
C.Species: Arabidopsis thaliana (mouse-ear cress)
C.Species: Arabidopsis thaliana (mouse-ear cress)
C.Date: 01-Feb-1999 #sequence_revision 01-Feb-1999 #text_change 09-Jul-2004
C.Accession: T006593, G848774
S.Rounsley, S.D.; Kaul, S.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, Esubmitted to the EMBL Data Library, June 1998
A.Description: Arabidopsis thaliana chromosome II BAC F6E13 genomic sequence.
A.Accession: T00693
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A, Status: translated from GB/EMBL/DDBJ

                                                                                                                                                                                                                                           Meinel T., Lazennec C., Villong S., Blanquet S.;

"Structure-function relationships within the peptide deformylase
"Structure-function relationships within the peptide deformylase
I family. Evidence for a conserved architecture of the active site
I involving three conserved motifs and a metal ion.";

J. Mol. Biol. 267:749-761(1997).

-!-FUNCTION: Removes the formyl group from the N-terminal Met of
newly synthesized proteins. Requires at least a dipeptide for an
efficient rate of reaction. N-terminal L-methionine is a
prerequisite for activity but the enzyme has broad specificity at
other positions (By similarity).

-!- CATALYTIC ACTIVITY: Formyl-L-methionyl peptide + H(2)O = formate +
methionyl peptide.

-!- COFACTOR: Binds 1 iron(II) ion (By similarity).

-!- SIMILARITY: Belongs to the polypeptide deformylase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                             Meinnel T., Blanguet S., "Characterization of the Thermus thermophilus locus encoding peptide deformylase and methionyl-tRNA(fmet) formyltransferase."; J. Bacteriol. 176:7387-7390(1994).

-! FUNCTION: Removes the formyl group from the N-terminal Met of newly synthesized proteins. Requires at least a dipeptide for an efficient rate of reaction. N-terminal L-methionine is a prerequisite for activity but the enzyme has broad specificity at other positions (By similarity).

-!- CATALYTIC ACTIVITY: Formyl-L-methionyl peptide + H(2)0 = formate + methionyl peptide.
-!- CORACTOR: Binds 1 iron(II) ion (By similarity).
-!- CORACTOR: Binds 1 iron(II) ion (By similarity).

"GENERALIVE AGENT OF CONTRACTORS DOVING PLEUTOPHEUMONIA (CREPP).";
GENOME Res. 14:221-227(2004).
-!- CATALYTIC ACTIVITY: ATP + Bytuvate = ADP + phosphoenolpyruvate.
-!- COFACTOR: Requires magnesium and potassium (By similarity).
-!- PATHWAY: Glycolysis; final step.
-!- SIBUINAT: Homotetramer (By similarity).
-!- SIMILARITY: Belongs to the pyruvate kinase family.
